

Overview of Entity Maps

Entity maps are a way to consolidate entities into more refined, higher-level concepts, and remove entities that are not relevant to your analysis.

For example, considering reviews of headphones, you may see a list of the following entities surfaced from the initial sentiment analysis.

In this example, entity maps would allow you to:

- Exclude the entities: “one,” “lot,” “everything,” and “something.”
- Group the entities: “price,” “money,” and “value” together into an entity group called “price/value.”
- Group the entities: “battery” and “battery life” into an entity group called “battery life.”

Then, when applied, the entity map will aggregate all the sentiment data into a single entity group. The example end group could look like this:

It's also possible to use entity maps to hone in on specific aspects of the reviews that you would like to analyze. In the example below, we've excluded all entities that did not relate to the usage of headphones:

Entity maps are transferable, meaning that once they are created you can apply them to any dashboard to create a common language for the different products, categories, and brands to be meaningfully compared.

With an entity map constructed, you can apply it like any other filter in the top-right of your dashboard. A filter lozenge in the top right will indicate whether the entity map is currently engaged. Once engaged, the entity map applies to the entire dashboard.

Creating Entity Maps

You can create and manage entity maps by clicking on the **Tools** section in the left-hand navigation menu of the platform.

Add item

+ Add entity group

Start by giving your entity map a name. Following the headphones example, it could be “Headphone Entity Map.” You can build the entire entity map out from this screen if you already know which entities you would like to group. However, to save the entity map you only need to include a single entity group (e.g. “price”), as in the example below. You can then save your entity map by clicking **Create Entity Map** and edit it within the dashboard.

[+ Add entity group](#)

Applying and Editing Entity Maps in Dashboards

To apply an entity map, open the filters in any dashboard, select the **Entity Map** dropdown, and click on the entity map you'd like to apply.

← Headphone category

Entity map: 'Headphones Entities'

Add to entity map Irrelevant

 Irrelevant

By taking this action, you are not deleting any data from your account but rather creating a lens through which to view your data. If you remove the entity map from the dashboard, then all of the entities will reappear.

If you make mistakes and wish to put back in irrelevant words, or move entities between groups, you can do this from the **Entity Maps** page under **Tools**.
